

Sales Performance Report.

Diagnose the dashboard's strongest patterns, uneven performance, and implications for the sales team.

EXECUTIVE READ

Performance is concentrated, not balanced.

Central and West lead the result. Standard Class carries the sales mix. Product and state views show reach, but not consistent productivity.

Performance is concentrated, not balanced.

The dashboard points to a few engines carrying the overall result.

01 Regional concentration

Central and West lead the regional totals, while South trails the other regions. The gap is large enough to make territory mix a first diagnostic.

02 Class concentration

Sales-class performance is highly uneven. Standard Class sits far ahead of First Class, Second Class, and Same Day.

03 Coverage without uniformity

Product and state views suggest broad reach, but the dashboard does not show that every category or location contributes at the same level.

Implication: investigate the operating patterns behind the leaders before treating the total as a balanced system.

Central and West carry the result.

325,811

Central leads the chart by a narrow margin over West.

325,375

West is effectively level with Central.

189,251

South is materially below the leading regions.

SALES CLASS

Standard Class is the clear engine.

Ship Class

634,728

Standard Class is far ahead of every other shipping class.

62,667

Same Day is the smallest class in the view.

That mix points to a volume-led business, with service-level economics still to be tested.

Source: dashboard image. Values shown exactly as labeled.

Technology categories show the tallest peaks.

The dashboard compares Furniture, Office Supplies, and Technology across regions.

FURNITURE

Lower, uneven bars

Several furniture categories sit below the tallest peaks in the comparison.

OFFICE SUPPLIES

Broad middle

The category spans the view, but the dashboard does not show uniform productivity across regions.

TECHNOLOGY

Tallest peaks

Phones and select technology categories appear among the strongest bars.

Next cut: compare each category by region. That separates true category demand from the effect of where sales are concentrated.

Broad coverage, limited differentiation.

The percentage view is more useful for checking coverage than ranking performance.

Read the normalized chart carefully.

The percentage chart repeats a 100% total across state and category combinations. Because every combination normalizes to the same whole, it does not distinguish absolute sales contribution.

Coverage check

Use the current view to see whether states and categories are represented.

Performance ranking

Do not use the normalized percentages to decide which states create the most value.

Decision-ready replacement

Rebuild the cut around absolute sales, margin, and growth by state.

Source: dashboard image. The repeated 100% totals are a property of the normalized view.

What the sales team should investigate next.

Move from visible concentration to testable operating questions.

01 Identify the leader pattern

Compare the operating practices, account mix, category mix, and rep coverage behind Central and West performance.

02 Isolate South's gap

Break South down by account, category, and rep to locate where the shortfall is concentrated.

03 Test Standard Class economics

Compare its volume with margin, delivery experience, and repeat purchase before setting a service-level strategy.

04 Rebuild the state view

Use absolute value and trend alongside percentages so the next ranking supports an actual sales decision.

The immediate goal is sharper diagnosis, not a premature target.

Data limitations and recommended next cut.

The dashboard image provides labeled totals and comparative bars, but it does not show the dimensions needed to separate scale, efficiency, and momentum.

MISSING VIEW	WHY IT MATTERS	RECOMMENDED NEXT CUT
Time series	Shows whether performance is accelerating or slowing.	Period-over-period growth by region, class, category, and state.
Ownership	Connects outcomes to the teams that can act.	Sales rep and account ownership in every major slice.
Economics	Tests whether volume creates profitable growth.	Gross margin, order count, and service-level measures.

Use the next version to distinguish **scale**, **efficiency**, and **momentum** before setting targets.

Source grounding: dashboard image and approved report brief. No causes are inferred beyond the visible comparisons.
